Excel sheet column numbers. Excel show column numbers. Print excel spreadsheet with column and row numbers. How to create number column in excel. How do i get column numbers in excel. How to add a column of numbers in excel spreadsheet. How do i add a column of numbers in an excel spreadsheet. Excel spreadsheet column numbers changed to letters.

While working in Excel, we often have to number our rows and columns for quick glancing and sophistication in analyzing. Today I will be showing how you can number columns in Excel automatically. Download Practice Workbook How to Number Columns in Excel Automatically (5 Easy Ways).xlsx How to Number Columns in Excel Automatically

Here we have a data set with the sales record of some products of some years in a company called Jupiter Group. Our objective today is to enter values inside the row called Product No., that is, to number the columns. 1. Using the Fill Handle You can use the Fill Handle of Excel to number the columns. Select the first cell and enter 1. Move your mouse cursor over the rightmost bottom corner of the first cell. You will find a small plus (+) sign. This is called Fill Handle. Drag the Fill Handle rightward up to your last non-blank row. You will find all cells of the column having the number 1 automatically. Then you will find a small drop-down menu in the rightmost bottom corner of the column called Auto Fill Options. Click it. After clicking the Auto Fill Options drop-down menu, you will find a few options. Click on Fill Series. You will find your columns numbered automatically 1, 2, 3, ..., etc. Read more: How to Number Rows Automatically in Excel 2. Using the Fill Series Tool from Excel Toolbar If you want, you can number your columns using the Fill Series tool from Excel Toolbar. Enter 1 in the first cell, then select the whole row. Go to the Home>Fill option (as seen in the image below) in the Excel toolbar under the section Editing. Click on the drop-down menu attached with the tool Fill. You will find a few options. Click on Series. You will get the Series dialogue box. From the Series in menu, select Rows. Then from the Type menu, select Linear. And in the Step value box, enter 1. Click on OK. You will find your columns numbered automatically 1, 2, 3, ..., etc. Read more: How to AutoFill Numbers in Excel Similar Readings 3. Using Excel Functions In case you don't like the procedures mentioned above, you can use Excel Functions to number your columns. Method 1: Using the COLUMN Function You can use the COLUMN function of Excel to number your columns. Select the first cell and enter this formula in the Excel Formula Bar: =COLUMN(Relative Cell Reference of the Cell)-COLUMN(Absolute Cell Reference of the Previous Cell) In this example, it will be: Then drag the Fill Handle rightward up to the last column. You will find all your columns numbered 1, 2, 3, ..., etc. Method 2: Using the OFFSET Function You can also use the OFFSET function of Excel to number columns in Excel. But you can use the OFFSET function for only those types of data sets where the immediate right cell of the first cell is blank. In our data set, the immediate right cell of our first cell (cell B3) is not blank and it contains the text "Product No". But look at the following data set. Here the immediate right cell is blank. For these types of data sets, enter this formula in the first cell: =OFFSET(Relative Cell Reference of the Previous Cell,0,0,1,1)+1 In this example, it will be: Then drag the Fill Handle rightward up to the last column. You will get all your columns numbered 1, 2, 3, ..., etc. Method 3: Using the IF, ISBLANK, and COUNTA Functions (For Columns with Blank Cells) This method will be useful when you have any blank columns in your data set. For example, let's think that Jupiter Group has stopped selling Smartphones, and that's why they have cleared the column Smartphone from their data set. You can use a combination of the IF, ISBLANK, and COUNTA functions of Excel for numbering the columns of these types of datasets. To number the columns of these types of data sets, enter this formula in the first cell: =IF(ISBLANK(C4),"",COUNTA(\$C\$4:C4)) Note: Here, C4 is the cell reference of the cell just below my first cell. You use your one. Then drag the Fill Handle rightward up to the last column. You will find your columns numbered excluding the blank column. Special Note: This is a dynamic formula. That means, if you have a data set with all the columns non-blank, then it will number all the columns like this. Then if you suddenly clear one column, it will automatically adjust and re-number them excluding the blank column. You will not need to do anything. Read more: How to Autofill a Column in Excel Conclusion Using these methods, you can number columns in Excel automatically. You can number them using either the tools or functions of Excel, the one you prefer. Do you have any questions? Feel free to ask us. Further Readings While performing a simple numbering in Excel, we manually provide a cell number for the serial number; we can also do it automatically. To do auto numbering, we have two methods. First, we can fill the first two cells with the series of the number we want to be inserted and drag it down to the end of the table. The second method is to use the =ROW () formula which will give us the number, and then drag the formula similar to the end of the table. For example, suppose you have a data set and want to start numbering them from 3 and step up by 4 until 40. First, you may select the cells containing the 3 and the 7. Then, click on the handle and drag to the other cells where you can see 40. You may then release and view that the numbers are filled in automatically. You may also use the Excel ROW function = ROW() formula that returns the row number for reference. For example, ROW(A3) returns 3 as A3 is the third row in the spreadsheet. If not given any reference, ROW returns the row number of the cell, which consists of the formula. Automatic Numbering in Excel Numbering means giving serial numbers or numbers to a list of data. In Excel, no special button is provided that offers numbering for our data. As we already know, Excel does not provide a method, tool, or button to provide the sequential number to a list of data, which means we need to do it manually. How to Auto Number in Excel? We need to remember that our autofill functionAutoFill in excel can fill a range in a specific direction by using the fill handle.read more is always turned on to create auto numbering in Excel. By default, it is turned on. But in any case, if it is not enabled or mistakenly disabled "AutoFill," here is how we can re-enable it. Now we have checked that the "Autofill" is enabled. There are three methods for Excel auto-numbering: Fill a column with a series of numbers.Using row() function.Using offset() function. The following are the steps for enabling fill handle and cell drag and drop: - In the "File" tab, go to "Options." In the advanced section, check the "Enable fill handle and cell drag and drop" in Excel under the editing options. Top 3 ways to get Auto Numbering in Excel There are various ways to get automatic numbering in Excel. Fill a column with a series of numbers. Use Row() functionUse Offset() Function Let us discuss all the above methods by examples. #1 - Filling the Column with a Series of Numbers We have the following data: We will insert automatic numbers in Excel "column A" following the below steps: We can select the cell we want to fill. In this example, we will choose cell A2.We will write the number we want to start with. Let it be 1, fill the next cell in the same column with another number, and let it be 2. To start a pattern, we have made the numbering 1 in cell A2 and 2 in cell A3. Next, we will select the starting values, i.e., cells A2 and A3. The arrow shows the pointer (dot) in the selected cell. Then, click on it and drag it to the desired range, cell A11. Now, we have sequential numbering for our data. #2 - Use ROW() Function We will use the same data to demonstrate the sequential numbering by the row() functionThe row function in Excel is a worksheet function that displays the current row index number of the selected or target cell. The syntax to use this function is as follows: =ROW(Value).read more. We select the specific cell where we want to start our automatic numbering in Excel (cell A2 in this case). We type ROW() in cell A2 and press "Enter." As a result, it gave us the numbering from number 2 since the row function throws the number for the current row. To avoid the above situation, we can give the reference row to the row function. Next, we click on the pointer or the dot in the selected cell and drag it to the desired range for the current scenario to cell A11. We have our automatic numbering in Excel for the data using the row() function. #3 - Using Offset() Function We can also achieve auto numbering in Excel using the Offset() functionThe OFFSET function in excel returns the value of a cell or a range (of adjacent cells) which is a particular number of rows and columns from the reference point. read more also. Let us use the same data to demonstrate the offset function. Below is the data: As we can see, we have removed the text written in cell A1 "Serial Number," as the reference needs to be blank while using the offset function. The above screenshot shows the function arguments used in the offset function. In cell A2, we type offset(A2,-1,0)+1 for the automatic numbering in Excel. A2 is the current cell address, which is the reference. Press the "Enter" key. It will insert the first number. Now, we select cell A2 and drag it down to cell A11. So, now we have sequential numbering using the offset function. Things to Remember about Auto Numbering in Excel Excel does not auto-provide auto-numbering. Do not forget to check for the enabled "AutoFill" option. While filling a column with a series of numbers, we must make a pattern. We can either use the starting values as 2 or 4 to create even sequential numbering. Auto Numbering in Excel Video Recommended Articles This article is a guide to Auto Numbering in Excel. Here, we discuss how to get sequential numbers in Excel using 1 Automatically) Fill the Column 2) ROW() Function and 3) Offset Function along with Excel examples and downloadable Excel templates.
